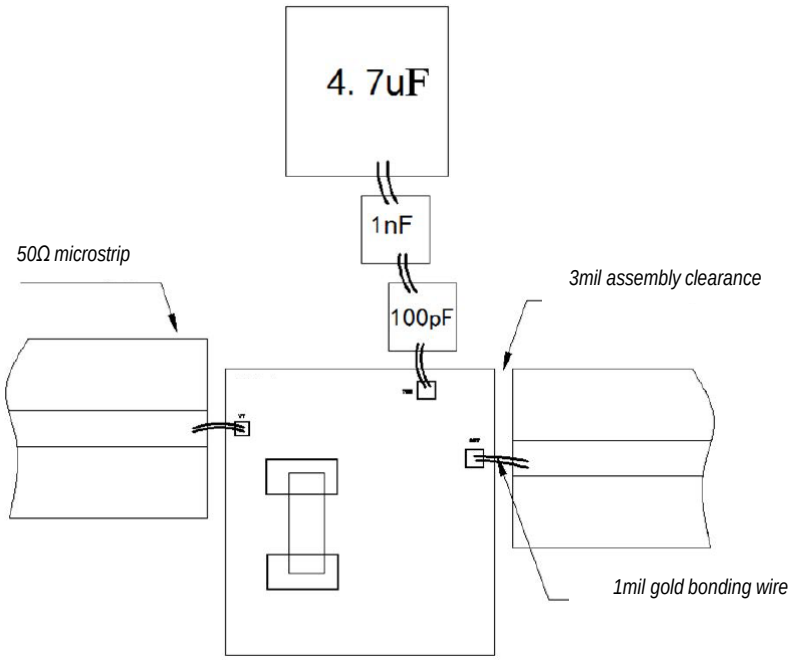
Assembly Drawing



VCO and Diode Assembly Instructions:

1. Attach the VCO die to the carrier, cavity or PCB.
2. Apply epoxy to the diode attachment pad on top of the VCO MMIC.
3. Attach the diode (N side) on top of the VCO, and make sure the epoxy does not overflow, short out, or allow any air voids underneath.
4. Bond the P side diode making sure to start from point #1 with 200-300um length of wire and end up at point #2.
5. The length of the wire will affect the frequency of oscillation. The longer the wire, the lower the frequency. The shorter the wire, the higher the frequency.
6. In order to increase the frequency, consider doubling the bonding wire to reduce the inductance.
7. In order to decrease the frequency, you can increase the length of the wire. Starting from point #1, then running the bonding wire to the die capacitor, then from the die capacitor bond back to the VCO MMIC Pad.
